

COVID-19 screening and monitoring survey

A Philips initiative, powered by Philips QuestLink

Track and assess COVID-19 cases remotely

Philips has developed a COVID-19 screening and monitoring survey that helps hospitals and care groups screen patients remotely. It also allows them to have patients self-monitor their condition through online surveys. This could decrease the number of unnecessary hospital visits or consultations between care professional and patients.

In the end, it is about protecting those who are vulnerable while helping care facilities deal with an increased pressure

on their capacity. And at the same time, by creating an overview of the non-diagnosed population, it becomes possible to gain an insight into the extent of the pandemic and population immunity.

The care organizations provide the patient with an online survey about basic demographic information, travel and contact history, symptoms and comorbidities. The results from this screening are used to generate a risk score per patient. Philips QuestLink, from which the survey is run, will position the patient in one of three risk groups based on the survey results:

A. High risk:

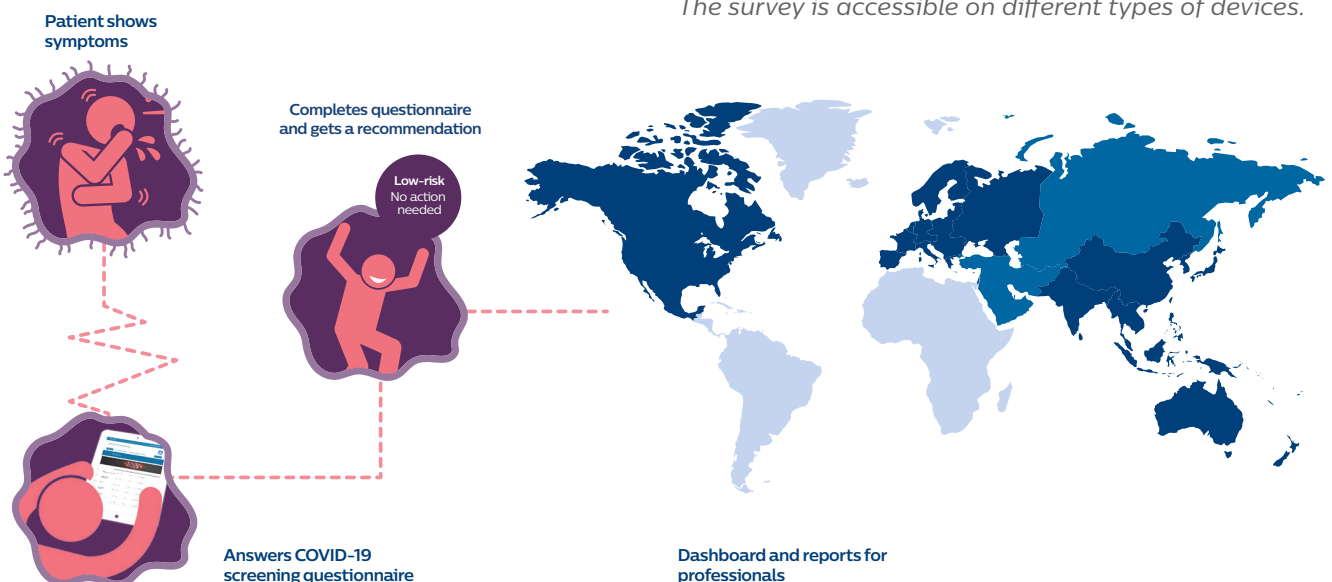

patient is asked to contact their closest health facility or GP

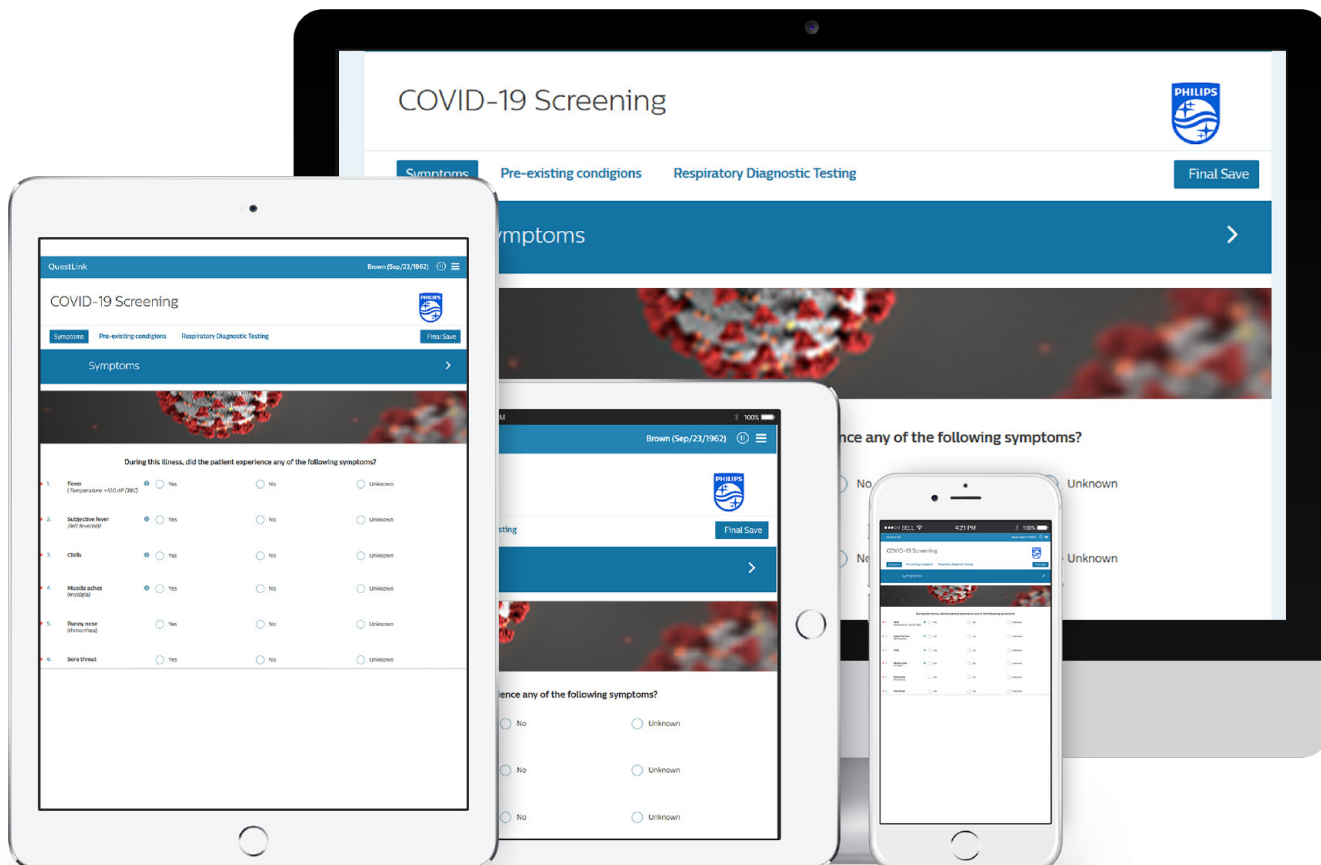

B. Medium risk:

patient is asked to monitor their health and symptoms using self-reported surveys

C. Low risk:

no action needed from patient

Benefits to citizen

- Possibility to reduce stress and anxiety related to the virus outbreak by gaining control and insights
- Ability to take action quickly based on the survey recommendations

Benefits to professional

- Use detailed COVID-19 questionnaires to virtually engage and track patients from their home setting in order to avoid unnecessary hospital visits:
 - Remote risk assessments with detailed COVID-19 questionnaires: age, gender, latest travels, symptoms, possible contact with known cases and more
 - Remote risk assessment before normal consultations: check every patient for possible symptoms and reduce high-risk visits
 - Track patients suffering from mild COVID-19 symptoms by gathering daily inputs such as temperature and other relevant vital signs
- COVID-19 dashboard with actionable population health data and insights such as trends and variation
- Possibility to reduce strain on your healthcare facilities and focus on patients who need care most based on risk assessments
